Minimum Viable Product: Elbe Rent

Capstone project, AWS Cloud Engineer (neuefische) · Oct 7, 2026 · @Navid

The MVP proves that a customer can search for a rental car and see the total price, fully serverless on AWS. It is done when the search runs through the CloudFront URL at close to 0 € per month, guarded by a 10 € budget alarm.

Architecture

MVP search path · 6 AWS components

User story

As a customer, I want to search for cars by city and dates, so that I can see which cars are available and what they cost in total.

- Search by city, pick-up date, return date and optional car type.
- Results show car details and total price, cheapest first; bad input shows an error.

Scope

In the MVP	Later phases
Website on S3 + CloudFront; search API with API Gateway + Lambda	Login (Cognito) and booking (Step Functions)
DynamoDB Fleet table: 10 cars in 3 cities; price per day × days	Notifications, pricing service, WAF, Route 53, CI/CD
